Here's a Strike Indicator that is adjustable and really stays on your line. It's made from high-density polystyrene and attaches to your line in seconds using a piece of natural rubber tubing.

To apply to your leader all you do is remove the rubber tube from the thru hole in the indicator and moisten the tube.

The manufacturer recommends that you use your teeth as a third hand to assist in this process.

This is a good time to apply moisture to the tube before you put it to use. Now fold your leader in half to create a small loop. Push the loop thru the bottom of the hole in the indicator until it comes out the top about 1/4 to 1/2 inch. Slip the moistened tube half way thru the loop and pull down on the leader until it draws the tube into the indicator, leaving about 1/16 to 1/8 inch remaining out of the top. Be sure to grab both halves of the leader when pulling down to draw the tube into the indicator.

The rubber tube acts as a retaining device to prevent the indicator from flying off of your line and doubles as a shock absorber while fighting a fish. It also keeps the indicator in place where you set it on your line.

It's wise to check your indicator right after fighting a fish or right after a snag. Reset the indicator if the tubing has been pulled below the top surface of the indicator. This will insure you 100% line retention to get the most use out of your indicator without loss. It only takes a few seconds to do this.

To adjust your preferred depth of presentation just slide the indicator up or down your line. This takes little effort but moves easier when the line is wet. You can even apply these indicators to a pre-existing rig without breaking down your setup because it's not necessary to cut anything off of your line.

The simplicity remains the same when it comes time to remove it from your leader. Just pull the tube out from the top or pull down on your line until the tube is exposed on the bottom of the indicator enough to grab it with your fingertips. Pull the indicator and tube in opposite directions until it is removed from your line.

Replace the tube back into the hole in the indicator and return it to the resealable package to use for another day. You can use the same indicator for more than one fishing trip because with this method they don't fly off of your line.

They are a perfect match with Knotless Tapered Leaders or hand tied leaders and work well with most brands of Braided Furred Tapered Leaders.

There are five different sizes in the round shape and five in the teardrop shape to choose from. They are as follows, ((3/8", 1/2", 5/8", 3/4" & 1") We currently offer 17 different color combinations.

The tubing is interchangeable throughout all the indicators with the exception of the 1" teardrop.

This 1" teardrop indicator requires larger tubing for a more secure setting because of it's size.

Visit the web site to see the seventeen different color combinations and ordering information.
